## SEIFA: Understanding Area \& Population Quantiles

Table 1

| Area | Score | Pop'n |
| :---: | :---: | :---: |
| A01 | 779 | 25 |
| A02 | 452 | 15 |
| A03 | 494 | 15 |
| A04 | 493 | 12 |
| A05 | 911 | 40 |
| A06 | 891 | 39 |
| A07 | 841 | 24 |
| A08 | 656 | 20 |
| A09 | 847 | 18 |
| A10 | 561 | 20 |
| A11 | 689 | 21 |
| A12 | 696 | 18 |
| A13 | 325 | 9 |
| A14 | 508 | 10 |
| A15 | 543 | 16 |
| A16 | 708 | 19 |
| A17 | 752 | 20 |
| A18 | 599 | 18 |
| A19 | 734 | 22 |
| A20 | 600 | 19 |

The example in this fact sheet uses 20 areas that have a total population of 400 . The scores and population of each area are listed in table 1.

## Quantiles

Quantiles is a collective word that includes quartiles (4), quintiles (5), deciles (10) and percentiles (100).

Only deciles and percentiles are published on the SEIFA spreadsheet but quintile can be derived by adding two deciles together and quartiles can be derived by adding 25 percentiles together.

If we ranked the table according to scores, we can then work out areas quintiles as demonstrated in Table 2.

There are 20 areas in total, so there will be four areas in each quintile. Areas with the lowest four scores make up Quintile 1, the next four in Quintile 2, etc.

This is how deciles and percentiles have been calculated on the SEIFA spreadsheet on the web. Instead of dividing 20 areas into 5 quintiles, it divides over 30,000 CDs for Australia in 10 deciles (or 100 percentiles) based upon the CD rankings.

Alternatively they are also available at a state level and, for example, divide 1000 Tas CDs into deciles and percentiles.

Table 2

| Area | Score | Rank | Quintile | Pop'n |
| :--- | :---: | :---: | :---: | :---: |
| A13 | 325 | 1 | 1 | 9 |
| A02 | 452 | 2 | 1 | 15 |
| A04 | 493 | 3 | 1 | 12 |
| A03 | 494 | 4 | 1 | 15 |
| A14 | 508 | 5 | 2 | 10 |
| A15 | 543 | 6 | 2 | 16 |
| A10 | 561 | 7 | 2 | 20 |
| A18 | 599 | 8 | 2 | 18 |
| A20 | 600 | 9 | 3 | 19 |
| A08 | 656 | 10 | 3 | 20 |
| A11 | 689 | 11 | 3 | 21 |
| A12 | 696 | 12 | 3 | 18 |
| A16 | 708 | 13 | 4 | 19 |
| A19 | 734 | 14 | 4 | 22 |
| A17 | 752 | 15 | 4 | 20 |
| A01 | 779 | 16 | 4 | 25 |
| A07 | 841 | 17 | 5 | 24 |
| A09 | 847 | 18 | 5 | 18 |
| A06 | 891 | 19 | 5 | 39 |
| A05 | 911 | 20 | 5 | 40 |

## Table 3

| Quintile | Area | Pop'n | Pop'n per quintile | \% Pop'n per quintile |
| :---: | :---: | :---: | :---: | :---: |
| 1 | A13 | 9 | 51 | 13\% |
|  | A02 | 15 |  |  |
|  | A04 | 12 |  |  |
|  | A03 | 15 |  |  |
| 2 | A14 | 10 | 64 | 16\% |
|  | A15 | 16 |  |  |
|  | A10 | 20 |  |  |
|  | A18 | 18 |  |  |
| 3 | A20 | 19 | 78 | 20\% |
|  | A08 | 20 |  |  |
|  | A11 | 21 |  |  |
|  | A12 | 18 |  |  |
| 4 | A16 | 19 | 86 | 22\% |
|  | A19 | 22 |  |  |
|  | A17 | 20 |  |  |
|  | A01 | 25 |  |  |
| 5 | A07 | 24 | 121 | 30\% |
|  | A09 | 18 |  |  |
|  | A06 | 39 |  |  |
|  | A05 | 40 |  |  |
|  |  | Total | 400 | 100\% |

If we grouped the areas according the quintile they fall in, we can create population counts for each area as shown in column 4. It is then possible to work our percentages as shown in column 5.

This table shows that $13 \%$ of the population live in the bottom $20 \%$ of areas and $30 \%$ of the population live in the top $20 \%$ of areas.

This is the kind of grouping that can occur with CDs. A recode of these re-grouped CDs can be created, loaded into SuperCROSS (or regrouped within SuperCROSS) and population counts extracted.

So far we have been looking at data based on an even distribution of the number of areas, what if we wanted to examine data based on an even distribution of number of people?

There are 400 people in this population, so there will need to be approximately 80 people in each quintile.

If we cumulatively add the population this means the cut-off for each quintile occurs at $80,160,240,320$ and 400 people. However, this 'cut-off' cannot 'split' an area, so the cut-off becomes the figure that is closest to having 80 people in each quintile. This is demonstrated in table 4.

Table 4

| Area Quintiles (20\% of areas in each quintile) |  |  |  | Pop'n Quintiles (20\% <br> Pop'n in each quintile) |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Area Quintile | Cumulative No. Areas | Area | Pop'n | Cumulative No. People | Pop Quintile |
|  | 1 | A13 | 9 | 9 |  |
|  | 2 | A02 | 15 | 24 |  |
|  | 3 | A04 | 12 | 36 |  |
| 1 | 4 | A03 | 15 | 51 |  |
|  | 5 | A14 | 10 | 61 |  |
|  | 6 | A15 | 16 | 77 | 1 |
|  | 7 | A10 | 20 | 97 |  |
| 2 | 8 | A18 | 18 | 115 |  |
|  | 9 | A20 | 19 | 134 |  |
|  | 10 | A08 | 20 | 154 | 2 |
|  | 11 | A11 | 21 | 175 |  |
| 3 | 12 | A12 | 18 | 193 |  |
|  | 13 | A16 | 19 | 212 |  |
|  | 14 | A19 | 22 | 234 | 3 |
|  | 15 | A17 | 20 | 254 |  |
| 4 | 16 | A01 | 25 | 279 |  |
|  | 17 | A07 | 24 | 303 |  |
|  | 18 | A09 | 18 | 321 | 4 |
|  | 19 | A06 | 39 | 360 |  |
| 5 | 20 | A05 | 40 | 400 | 5 |

Table 4 show area quintiles against population quintiles. There are 51 people or $13 \%$ of the population in the lowest Quintile (or lowest $20 \%$ ) of areas.

However, $20 \%$ (or really $19 \%$ which is the closest we can get to $20 \%$ ) of people live in the lowest 6 ranking areas (the lowest $30 \%$ of ranked areas) while a different $20 \%$ of the population can be found in just two (10\%) of the highest ranked areas.

## What should I use?

Use area quantiles when you want to look at the distribution of people based on the kind of area they live in. Use population quantiles when you want to look at counts of areas based on an even distribution of people.

For the most part you will need to use area quantiles and these are what are currently available on the SEIFA spreadsheets on the web.
